Qualification and Reliability Test Report for
Statham Absolute Pressure Transducer

Appendix A

I. INTRODUCTION

This report describes the results of the qualification tests that were conducted on Statham Instruments absolute pressure transducer Model PA334TC-2.5M in accordance with Aerojet-General Specification 32060A Type II.

II. SUMMARY

Five Statham Instruments absolute pressure transducers Model PA334TC-2.5M were subjected to the tests as described in Appendix A. A part of the qualification test requirements were satisfied on the basis of similarity to absolute pressure transducer Model PA334TC-750 which was previously qualified as described in Report 0162-01DR-22.

III. TEST PROGRAM

Absolute pressure transducers, SN 447, 487, 491, 493, and 703, were subjected to performance, frequency response, motor static firing, and safety reliability tests. Remainder of the qualification tests including vibration, acceleration, temperature-altitude, altitude, humidity, hermetic seal, radio-frequency interference, and performance reliability were performed on transducer Model PA334TC-750 and are considered applicable to Model PA334TC-2.5M based on the similarity of the two parts.

The pressure transducer tests conducted at Aerojet are as follows.

A. PERFORMANCE (CALIBRATION)

Each transducer was subjected to pre- and posttest calibration after each qualification test. The tests were conducted to determine insulation resistance, circuit isolation, primary power

current, linearity, hysteresis, repeatability, zero output, full-scale output, temperature effects, output of 150% full-scale (FS) pressure (voltage limiting), residual noise at FS pressure and shunt calibration.

B. FREQUENCY RESPONSE

For the frequency response tests transducers SN 487 and 703 were subjected to pressure shocks while mounted in the expansion section of a shock tube. The results, including pre- and posttest performance data, are as shown in Appendix A.

C. MOTOR AND IGNITER FIRINGS

Transducer SN 493, 703, and 477 were tested on five static firings of Minuteman second-stage motors. SN 493 and 703 were used in two tests and SN 477 was used in one test. Data obtained from these tests were compared with output data of a reference pressure transducer used for measuring chamber pressure during motor static firings. Prior to and following each test the transducers were subjected to performance tests and the results are shown in Appendix A.

Transducers SN 493 and 477 were subjected to five igniter firings. The results from the igniter firings and the pre- and post-test calibrations are shown in Appendix A.

D. SAFETY RELIABILITY

Safety reliability tests were conducted on two transducer housings to verify structural integrity of the units.

IV. CONCLUSIONS

Successful completion of the qualification tests conducted on Statham absolute pressure transducer Model PA334TC-2.5; SN 447, 487, 491, 493, and 703; have qualified the transducer for use on second-stage Minuteman motors.

Appendix A

1.0 Object

The purpose of this program was to determine compliance of Statham Instruments Model PA334TC-2.5M pressure transducer with the requirements set forth in Paragraph 2.0.

2.0 Test Requirements

Perform qualification tests (Pre-production and Reliability) on Statham Instruments Model PA334TC-2.5M pressure transducer to verify compliance with design requirements of Aerojet-General Component Specification 32060A Type II. Unless otherwise indicated, paragraph numbers referenced in this Report are those of the Aerojet-General Corporation Specification.

3.0 Description of Test Specimens

Five Statham Model PA334TC-2.5M pressure transducers were submitted for tests as described above. Three were used for frequency response tests and two for safety tests and motor static test firings. The specimens were arbitrarily assigned numbers as follows:

<u>Serial No.</u>	<u>Specimen No.</u>
477	1
493	2
703	3
491	4
487	5

4.0 Conclusion

4.1 Qualification Testing

The transducers were subjected to the test program as required. The transducers complied with all requirements of the specification based on tests performed and on the basis

Appendix A

of similarity to the Statham Model PA3345C-750 previously qualified to Aerojet Specification 32060 Type I. Each test is so indicated where similarity is used as a basis for qualification. For details of these tests see Aerojet Report 0162-Oldr-22, "Qualification Test Report for Statham Operational Pressure Transducer and CTLI Pressure Measuring System".

5.0 Test Procedures and Results

5.1 Examination of Product

Test by: R. E. Leeds

Test started: 3 Mar 63

Test completed: 3 Mar 63

5.1.1 Test Requirement

Aerojet-General Corporation Specification 32060A. Paragraphs 3.6.1, 3.6.2 and 3.7. Specimens 1 through 5.

Examination: Visual and manual.

5.1.2 Test Method

The pressure transducers were examined visually to determine compliance with engraving, finish, and workmanship. The pressure transducers were manually measured to determine dimensional and weight compliance with the specification.

5.1.3 Test Results

Visual: The transducers conformed to all visual requirements relating to marking, cleanliness, workmanship, and general appearance.

Manual: Results of the dimensional measurements are presented in Figures 1 and 2.

Comments: Dimensional measurements and weight of the transducers complied with the specification requirements.

Appendix A

5.1.4 Test Equipment

5.1.4.1 Calipers

5.1.4.2 Tragkraft, Mikro Doft Scales

5.2 Performance

5.2.1 Insulation Resistance and Excitation Circuit Isolation

Test by: Dept. 8772

Test started: 5 Dec 62

Test completed: 5 Dec 62

5.2.1.1 Test Requirement

Aerojet-General Corporation Specification 32060A,

Paragraphs 3.3.13.1 and 3.3.13.2. Specimen No's.

1, 2, 3, 4, and 5

Insulation Resistance: 1 megohm minimum at 50 v dc

Excitation Isolation: 1 megohm minimum at 50 v dc

5.2.1.2 Test Method

The insulation resistance between all connector pins and the transducer case was measured at 50 v dc. The excitation isolation was measured between pins A and D and output pins B and C.

5.2.1.3 Test Results

The transducers complied with all test requirements of paragraph 5.2.1.1. Data and test results are shown in Figure 3.

5.2.1.4 Test Equipment

5.2.1.4.1 Insulation Tester

5.2.2 Output Impedance

Appendix A

5.2 Performance

5.2.2.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.3.15.

Output Impedance: 1000 ohms maximum.

5.2.2.2 Test Method

This test not required since the unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

5.2.3 Bridge Excitation Power Supply

5.2.3.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.3.16.

Excitation Current: Less than 70 milliamperes at
28 \pm 2 v dc.

5.2.3.2 Test Method

This test not required since the unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060 Paragraph 4.4.3.

5.2.4 Recovery from Primary Power Transients

5.2.4.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.3.17.

Transient Amplitude: 45 v dc

Transient Duration: 500 millisec

Appendix A

5.2 Performance

Output Amplitude Change, 150 millivolts (P-P) maximum

Output Amplitude Change Duration: 50 millisec maximum

5.2.4.2 Test Method

This test was not required since the unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060. Paragraph 4.4.3.

5.2.5 Noise (Broad band)

5.2.5.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.3.3.

Output (broad band) noise: Less than 25 millivolts peak to peak.

5.2.5.2 Test Method

This test was not required since the unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification, Paragraph 4.4.3.

NOTE: A noise test is performed on all transducers during receiving inspection.

5.2.6 Functional Calibration

Test by: Dept. 8772

Test started 5 Dec 62

Test completed 5 Dec 62

5.2.6.1 Test Requirement

Aerojet-General Corporation Specification 32060. Paragraphs 3.3.2, 3.3.2.2, 3.3.4, 3.3.5, 3.3.12.6.3 and 3.3.14.

Appendix A

5.2 Performance

Excitation: 28 v dc

Pressure: 0 to 2500 psig, 3 calibration cycles

Zero Output Voltage: Output voltage at 0.1 psia

5.2.6.2 Test Method

The pressure port of the transducer was connected to a dead weight pressure system capable of producing pressure variation from 0 psig to 2500 psig. For verification of zero output voltage the pressure system incorporated a vacuum pump to produce pressures below atmospheric. The transducer was energized with 28 v dc. A calibration cycle consisted of 11 pressure points taken in 500 psig increments from 0 psig increasing to 2500 psig and decreasing to 0 psig. Three calibration cycles were performed.

Upon completion of each of the three calibration cycles, the zero balance was recorded at less than 0.1 psia. A simulated pressure calibration was performed at the completion of the three cycles. After each calibration cycle, the data was interpreted for non-linearity, hysteresis, repeatability, full scale output voltage, zero output voltage and simulated pressure calibration accuracy.

5.2.6.3 Test Results

The transducers complied with all test requirements of Paragraph 5.2.6.1. Figures 5 through 9 show test results. The definitions used in the data reduction and presentation of results are as described in Paragraph 6.3 of Aerojet specification 32060.

Apperdix A

5.2 Performance

5.2.6.4 Test Equipment

5.2.6.4.5 Vacuum Pump

5.2.6.4.6 Dual Seal Temperature Oven Statham Model TC-2

5.2.7 Zero and Sensitivity Shift with Temperature

Test by. Dept 8772

Test started. 5 Dec 63

Test completed 5 Dec 63

5.2.7.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraphs 3.3.9, 3.3.10 and 3.3.11

Zero Shift. Less than 0.02% FS/^oF

Sensitivity shift. Less than 0.02% FS/^oF

5.2.7.2 Test Method

The transducer was placed in a temperature test chamber pre-adjusted to maintain a constant temperature of + 30^oF. The transducer pressure port was connected to a dead weight pressure system capable of producing pressure variation from 0 psig to 2500 psig. The pressure system also incorporated a vacuum pump and a vacuum gage. A potential of 28 v dc was applied and a calibration performed consisting of 11 pressure points taken in 500 psig increments from 0 psig increasing to 2500 psig and decreasing to 0 psig. This procedure was repeated at temperatures of 30, 75, and 150^oF. A simulated pressure

Appendix A

5.2.7.2 Test Method (cont)

calibration was performed when the transducer was stabilized at 75°F.

5.2.7.3 Test Results

The transducers complied with all test requirements of Paragraph 5.2.7.1. Output values during the temperature tests are shown in Figures 5 through 9.

5.2.7.4 Test Equipment

5.2.7.4.1 Amthor Dead Weight Tester Model 460

5.3 Vibration

5.3.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraphs 3.4.2(e), 4.7.1.1

Excitation: 28 v d-c

Vibration: Sinusoidal and random per Figures 2 and 3 of Aerojet-General Specification 32060.

Performance Verification: Per Paragraph 5.2.6 of this document.

5.3.2 Test Method

This test not required. Unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

Appendix A

5.4 Acceleration

5.4.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.4.2(a) and 4.7.1.2

Acceleration: ± 15 g three mutually perpendicular axes

Duration: 3 minutes each direction

Excitation: 28 \pm 0.01 v d-c

Performance Verification: Per Paragraph 5.2.6 of this document

5.4.2 Test Method

This test not required. Unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

5.5 Temperature Altitude

5.5.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.4.1(e) and 4.7.1.3.

5.5.1.1 Ambient Pressure: 6.8 psia (20 000 ft)

Temperature: -45°F to + 160°F

Duration: 4 minutes

Performance Verification: Strip Chart recording during test, and per Paragraph 5.2.6 of this document following exposure.

5.5.2 Test Method

This test not required. Unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

Appendix A

5.6 Altitude

5.6.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.4.2(d) and 4.7.1.3.1.

Excitation: 28 v d-c

Ambient Pressure: 240 microns-Hg (200,000 ft)

Performance: Per Paragraph 5.2.6 of this Report

5.6.2 Test Method

This test not required. Unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

5.7 Humidity

5.7.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.4.1(a) and 4.7.1.4

Excitation: 28 v d-c

Relative Humidity: 95%

Temperature: 110°F and 120°F

Duration: 100 cycles at 2 hr/cycle

5.7.2 Test Method

This test not required. Unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

5.8 Hermetic Seal

5.8.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 4.7.1.6

Appendix A

5.8 Hermetic Seal

5.8.2 Test Method

This test not required. Unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

5.9 Radio Frequency Interference

5.9.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.3.3.2 and 4.7.1.11

5.9.2 Test Method

This test not required. Unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

5.10 Repeat Performance

Following completion of all environmental tests, the transducer shall demonstrate continued satisfactory performance in accordance with the tests specified in Paragraph 5.2 of this document. This test not required. Unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

5.11 Frequency Response

Test by M. A. Henry

Test started. 5 Nov 1962

Test completed. 12 Dec 1963

5.11.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 3.3.7.2

Appendix A

5.11 Frequency Response

Specimen No's. 3 and 5

Excitation: 28 v d-c

Response Time: Less than 1 millisecc from 10 to 90% full scale
when stimulated with a full-scale pressure step
function.

5.11.2 Test Method

The transducer was installed in the expansion section of a shock tube. The driver section of the shock tube was pressurized and the diaphragm separating the driving and expansion sections was ruptured. The response of the transducer to the shock pressure was generated when the diaphragm rupture was recorded on an oscilloscope and photographed.

The frequency response testing was conducted using the shock tube at the Aerojet Azusa facility. Pressure shock amplitudes varying from 400 to 1000 psig were applied.

5.11.3 Test Results

The transducers complied with all test requirements of Paragraph 5.11.5. Data and test results are shown in Figures 10 through 15.

Three test specimens were tested at the Azusa shock tube test facility. Two of the test specimens met the rise time requirements (Reference Aerojet Specification 32060, Paragraph 5.11.5); however, both units failed the performance calibration test performed after the shock tube tests. The third unit failed to meet the rise time requirement.

Appendix A

5.11 Frequency Response

Inspection of the test specimens showed that the outer diaphragm (approximately 0.002 in. thick) which transmits the damping fluid to the inner (senior) diaphragm (approximately 0.025 in. thick). The resultant damage was deformation and rupture of the outer diaphragm. This caused the loss of the damping fluid which also acts as the coupling between the diaphragms. Therefore, the performance of the transducer was severely degraded. It was found that the pressure step caused a mechanical shock of 1000 g's. A redesign of the pressure transmitting system within the transducer was required so that testing could be completed on schedule. The redesign eliminated the outer diaphragm, the orifice, and the damping fluid. The new design uses only the pressure sensing diaphragm.

Two test specimens of the new design were again tested. The transducers complied with all test requirements of paragraph 5.11.5. Test results indicate that the dynamic characteristics of the transducer are repeatable at the various pressure levels verifying the linearity of the transducer dynamic characteristics.

5.11.4 Test Equipment

5.11.4.1 Shock Tube

5.11.4.2 Oscilloscope

5.12 Motor and Igniter Test Firings

5.12.1 Test Requirements

Aerojet-General Corporation Specification 32060, Paragraph 3.0,

Appendix A

5.12 Motor Static Test Firings

Specimen No.'s: 1, 2, and 3

The object of the tests are to prove the capability of the test specimens to meet all performance characteristics under actual operating conditions. Performance verification per Paragraph 5.2.6 was conducted after each test.

5.12.2 Test Method

5.12.2.1 The test specimen's were installed on five second-stage Minutemar motors to monitor igniter pressures during static test firings. Identical hardware and installation methods were used to mount the test specimen as those used on flight-test motors. For comparative purposes, a pressure transducer used to monitor chamber pressure was used as a reference with the test specimen. Pressure transducer output from both the test specimen and the reference was monitored and recorded during the motor firings on an oscillograph.

5.12.2.2 The test specimens were subjected to five igniter firings for each of two tests. The igniters were fired in a special igniter test fixture. For comparative purposes, a reference pressure transducer was connected to the igniter pressure chamber monitoring igniter pressure simultaneously with the test specimens, pressure transducer output from both the test specimen and the reference was monitored and recorded during the igniter firings on an oscillograph.

Appendix A

5.12 Motor Static Test Firings

5.12.3 Test Results

The transducers complied with all test requirements of Paragraph 5.12.1. Pre- and posttest calibration of the transducers and data from the motor firings are shown in Figures 16 through 37. Results from the igniter firings are shown in Figures 38 through 62.

5.13 Reliability

5.13.1 Performance Reliability

5.13.1.1 Test Requirement

Aerojet-General Corporation Specification 32060, Paragraph 4.7.1.13.1.

Excitation: 28 v d-c

Temperature: $75 \pm 10^{\circ}\text{F}$

Duration: 30 minutes

Pressure: Room ambient

Temperature-time Profile: (Established from the tests of Paragraph 5.5 of this Report).

Vibration: Sinusoidal and random as per Figures 2 and 3 of Aerojet Specification 32060.

Performance Tests: Per Paragraph 5.2.6 of this Report.

5.13.1.2 Test Method

5.13.1.2.1 This test not required. Unit is considered qualified based on similarity to Statham Model PA334TC-750 previously qualified to Aerojet Specification 32060, Paragraph 4.4.3.

Appendix A

5.13.2 Safety Reliability

Test by: Dept. 3830

Test started: 6 Feb 63

Test completed: 17 April 63

5.13.2.1 Test Requirement

Aerojet-General Corporation Specification 32060A, Paragraph 3.5.1.

Safety Reliability 1558 minimum applications of 5000 psig to two transducer pressure housings.

5.13.2.2 Test Method

A pressure cycling device was fabricated which enabled repeated application of 5000 psig to two pressure transducers. The transducers were manifolded to the pressure cyclor and 5000 psig pressure applications were applied for a minimum of 1558 consecutive times. Following the pressure cycling, the transducers were examined for evidence of physical deformation and leakage.

5.13.2.3 Test Results

The transducers complied with all test requirements of Paragraph 5.14.1. Test methods and results are shown as follows.

The Safety Reliability Test was started 2 February 1963. The test setup was as shown in Figures 63 and 64. Test specimens were pulsed 1 pressure application of 5000 psi and pressure released. Visual inspection revealed no visible leaks. Testing continued for 44 pressure cycles. (1 sec pressure, 1 sec no pressure) using an electrical sequencer

Appendix A

5.13.2 Safety Reliability

for cycle control. After 45 pressure cycles a leak was detected in both test specimens.

A failure diagnosis study showed the six 6-32 by 0.375-in.-long cap screws used to secure the pressure cap to the transducer housing were of too low a tensile strength and stretched which allowed the pressure cap to unseat from the transducer housing thereby causing pressure release. The cap screws were replaced with 6-32 by 0.375-in.-long alloy steel cap screws which have a higher tensile strength than those originally used and testing was continued.

The two test specimens were subjected to an additional 778 pressure cycles of 5000 psig after the cap screw replacement. A visual posttest observation of the specimens revealed no leakage of hydraulic oil; no longitudinal or radial deformation of the cases was evident. Pre- and posttest micrometer measurements of case diameter were identical. High tensile strength screws will be used in all transducers of this model delivered to Aerojet.

5.13.2.4 Test Equipment

7.17 Pressure Cyclor equipment including:

- a. Hydraulic supply, (5000 psig) Nankervis model 9440B
- b. Pressure valve, Futuromatic Solenoid, 3-way, 0 to 6000 psi, A/N 20896
- c. Pressure system monitor, Taber Pressure Transducer, range 0 to 10K with C.E.C. recording oscillograph, Type 5-119.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Aerojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test XI) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Aerojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test XI) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Aerojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test XI) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Aerojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test XI) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Aerojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test XI) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Aerojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test XI) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Anrojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test XI) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Aerojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test XI) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Aerojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test II) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.

GENERAL NOTES:

- All readings shall be taken at 75 \pm 5°F unless otherwise specified.
- The transducer excitation voltage shall be 28 \pm 0.2 VDC.
- 10,000 units shall equal 100% full scale transducer reading.
- X = not applicable.
- A 5-minute warmup time is required for each transducer.
- These calibration data sheets shall be used with the latest revision of Aerojet Calibration Procedure ACP A-2416.
- The "D" inspection stamp is used to indicate that transducer is subject to materials or engineering review. Use of this stamp requires discrepant transducer to be diverted from normal production use until a review decision is made.

SPECIFIC TEST NOTES:

- Balance transducer output to zero at atmospheric pressure, apply 2500 psig pressure and range type "C" calibrator for 10,000 units on first cycle only.
- Linearity tolerance applies to increasing portion of pressure cycle only.
- Balance transducer output to zero at atmospheric pressure for shunt calibration.
- Unbalanced transducer zero output (test XI) shall be recorded at 5.0 mm Hg or less.
- Negative voltage reading shall not be accepted at 75 \pm 5°F.
- Read and record transducer output voltage at atmospheric pressure. Apply 2500 psig, read and record output voltage. Subtract the voltage reading at atmospheric from the voltage reading at 2500 psig and record the difference in column A as full scale output at each temperature point.
